

### Important notice

Dear Customer,

On 7 February 2017 the former NXP Standard Product business became a new company with the tradename **Nexperia**. Nexperia is an industry leading supplier of Discrete, Logic and PowerMOS semiconductors with its focus on the automotive, industrial, computing, consumer and wearable application markets

In data sheets and application notes which still contain NXP or Philips Semiconductors references, use the references to Nexperia, as shown below.

Instead of <a href="http://www.nxp.com">http://www.nxp.com</a>, <a href="http://www.semiconductors.philips.com/">http://www.nxp.com</a>, <a href="http://www.nexperia.com/">http://www.nexperia.com/</a>, <a href="http://www.nexperia.com/">use http://www.nexperia.com/</a>

Instead of sales.addresses@www.nxp.com or sales.addresses@www.semiconductors.philips.com, use salesaddresses@nexperia.com (email)

Replace the copyright notice at the bottom of each page or elsewhere in the document, depending on the version, as shown below:

- © NXP N.V. (year). All rights reserved or © Koninklijke Philips Electronics N.V. (year). All rights reserved

Should be replaced with:

- © Nexperia B.V. (year). All rights reserved.

If you have any questions related to the data sheet, please contact our nearest sales office via e-mail or telephone (details via **salesaddresses@nexperia.com**). Thank you for your cooperation and understanding,

Kind regards,

Team Nexperia

File under Integrated Circuits, IC06

December 1990

## 74HC/HCT4351

#### **FEATURES**

- Wide analog input voltage range: ± 5 V
- Low "ON" resistance:

80  $\Omega$  (typ.) at  $V_{CC} - V_{EE} = 4.5 \text{ V}$ 

70  $\Omega$  (typ.) at V<sub>CC</sub> – V<sub>EE</sub> = 6.0 V

60  $\Omega$  (typ.) at  $V_{CC} - V_{EE} = 9.0 \text{ V}$ 

- Logic level translation: to enable 5 V logic to communicate with ± 5 V analog signals
- Typical "break before make" built in
- · Address latches provided
- · Output capability: non-standard
- I<sub>CC</sub> category: MSI

#### **GENERAL DESCRIPTION**

The 74HC/HCT4351 are high-speed Si-gate CMOS devices. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4351 are 8-channel analog multiplexers/demultiplexers with three select inputs ( $S_0$  to  $S_2$ ), two enable inputs ( $\overline{E}_1$  and  $E_2$ ), a latch enable input ( $\overline{LE}$ ), eight independent inputs/outputs ( $Y_0$  to  $Y_7$ ) and a common input/output (Z).

With  $\overline{E}_1$  LOW and  $E_2$  is HIGH, one of the eight switches is selected (low impedance ON-state) by  $S_0$  to  $S_2$ . The data at the select inputs may be latched by using the active LOW latch enable input ( $\overline{\text{LE}}$ ). When  $\overline{\text{LE}}$  is HIGH the latch is transparent. When either of the two enable inputs,  $\overline{E}_1$  (active LOW) and  $E_2$  (active HIGH), is inactive, all 8 analog switches are turned off.

 $V_{CC}$  and GND are the supply voltage pins for the digital control inputs (S $_0$  to S $_2$ ,  $\overline{LE}$ ,  $\overline{E}_1$  and E $_2$ ). The V $_{CC}$  to GND ranges are 2.0 to 10.0 V for HC and 4.5 to 5.5 V for HCT. The analog inputs/outputs (Y $_0$  to Y $_7$ , and Z) can swing between V $_{CC}$  as a positive limit and V $_{EE}$  as a negative limit

V<sub>CC</sub> - V<sub>EE</sub> may not exceed 10.0 V.

For operation as a digital multiplexer/demultiplexer,  $V_{\text{EE}}$  is connected to GND (typically ground).

#### **QUICK REFERENCE DATA**

 $V_{EE} = GND = 0 \text{ V}; T_{amb} = 25 \, ^{\circ}\text{C}; t_r = t_f = 6 \text{ ns}$ 

| SYMBOL                              | PARAMETER   | CONDITIONS   | TYP | UNIT |      |
|-------------------------------------|---|--|-----|------|------|
| STIVIBUL                            | PARAMETER   | CONDITIONS   | нс  | нст  | UNII |
| t <sub>PZH</sub> / t <sub>PZL</sub> | turn "ON" time $\overline{E}_1$ , $E_2$ or $S_n$ to $V_{os}$  | $C_L = 15 \text{ pF}; R_L = 1 \text{ k}\Omega; V_{CC} = 5 \text{ V}$ | 27  | 35   | ns   |
| t <sub>PHZ</sub> / t <sub>PLZ</sub> | turn "OFF" time $\overline{E}_1$ , $E_2$ or $S_n$ to $V_{os}$ |  | 21  | 23   | ns   |
| Cı                                  | input capacitance   |  | 3.5 | 3.5  | pF   |
| C <sub>PD</sub>                     | power dissipation capacitance per switch                      | notes 1 and 2  | 25  | 25   | pF   |
| Cs                                  | max. switch capacitance                                       |  |     |      |      |
|                                     | independent (Y)   |  | 5   | 5    | pF   |
|                                     | common (Z)  |  | 25  | 25   | pF   |

#### **Notes**

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu W$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum \{(C_L + C_S) \times V_{CC}^2 \times f_o\}$$
 where:

f<sub>i</sub> = input frequency in MHz

 $f_0$  = output frequency in MHz

C<sub>L</sub> = output load capacitance in pF

C<sub>S</sub> = max. switch capacitance in pF

 $\sum \{(C_L + C_S) \times V_{CC}^2 \times f_o\} = \text{sum of outputs}$ 

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is  $V_I = GND$  to  $V_{CC}$ For HCT the condition is  $V_I = GND$  to  $V_{CC} - 1.5$  V

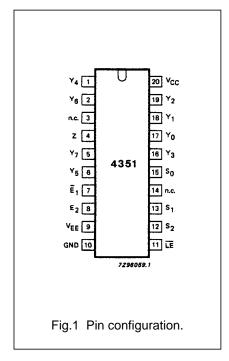

#### ORDERING INFORMATION

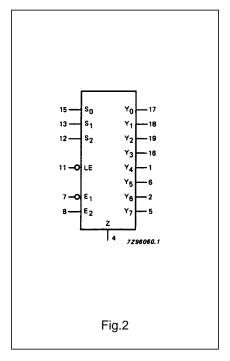

See "74HC/HCT/HCU/HCMOS Logic Package Information".

### Note to ratings

1. To avoid drawing  $V_{CC}$  current out of terminal Z, when switch current flows in terminals  $Y_n$ , the voltage drop across the bidirectional switch must not exceed 0.4 V. If the switch current flows into terminal Z, no  $V_{CC}$  current will flow out of terminals  $Y_n$ . In this case there is no limit for the voltage drop across the switch, but the voltages at  $Y_n$  and Z may not exceed  $V_{CC}$  or  $V_{EE}$ .

#### **Notes to DC characteristics**

- At supply voltages (V<sub>CC</sub> V<sub>EE</sub>) approaching 2.0 V, the analog switch ON-resistance becomes extremely non-linear.
  There it is recommended that these devices be used to transmit digital signals only, when using these supply voltages.
- 2. For test circuit measuring R<sub>ON</sub> see Fig.8.

# 8-channel analog multiplexer/demultiplexer with latch

74HC/HCT4351

### DC CHARACTERISTICS FOR 74HC

Voltages are referenced to GND (ground = 0 V)

### Note to HCT types

1. The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given here. To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

| INPUT                | UNIT LOAD COEFFICIENT |
|----------------------|-----------------------|
| $\overline{E}_1,E_2$ | 0.50                  |
| C                    | 0.50                  |
| LE                   | 1.5                   |

### **Notes to AC characteristics**

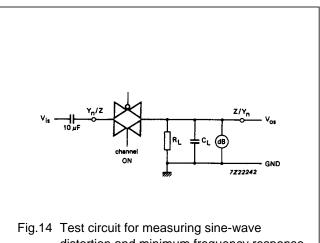

- 1. Adjust input voltage  $V_{is}$  to 0 dBm level (0 dBm = 1 mW into 600  $\Omega$ ).
- 2. Adjust input voltage  $V_{is}$  to 0 dBm level at  $V_{os}$  for 1 MHz (0 dBm = 1 mW into 50  $\Omega$ ).

 $V_{is}$  is the input voltage at a  $Y_n$  or Z terminal, whichever is assigned as an input.  $V_{os}$  is the output voltage at a  $Y_n$  or Z terminal, whichever is assigned as an output.
